FOREWORD

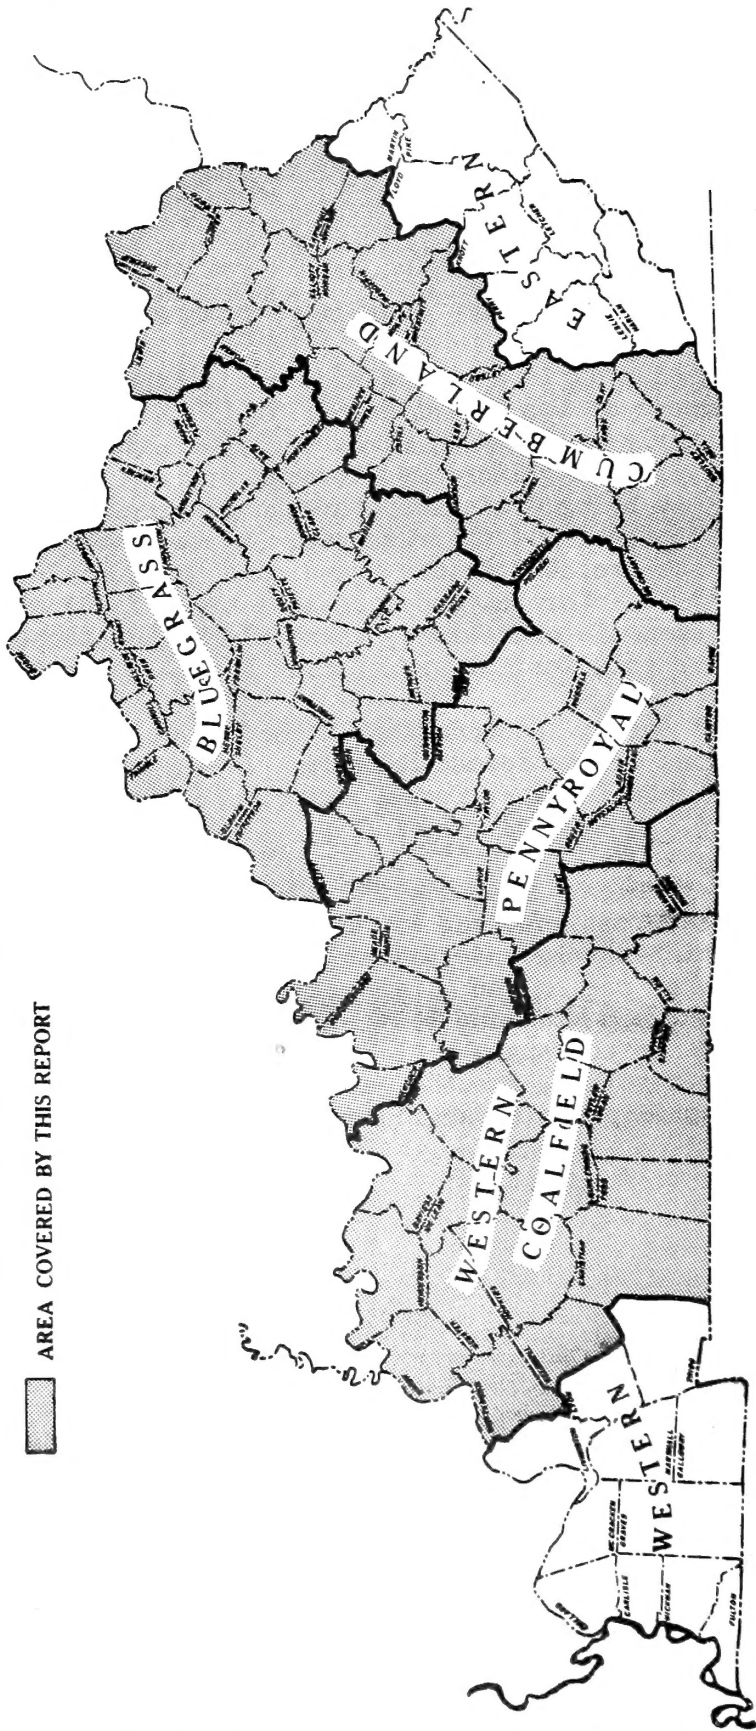

The Forest Survey is a nation-wide activity of the Forest Service. The fivefold purpose of the Forest Survey is (1) to make a field inventory of the present supply of standing timber; (2) to ascertain the rate at which this supply is being increased through growth; (3) to determine the rate at which it is being diminished through industrial and domestic uses, windfall, fire, disease, and other causes; (4) to determine the present consumption and the probable future trend in requirements for forest products; and (5) to interpret and correlate these findings with existing and anticipated economic conditions, as an aid in the formulation of both private and public policies for use of land suitable for forest production.

The Forest Survey is conducted in the various regions by the forest experiment stations of the Forest Service. In Kentucky the project is directed by the Central States Forest Experiment Station with headquarters in Columbus, Ohio.

This Survey Release presents the more significant preliminary statistics on the forest area and timber volume for each of the four regions of Central Kentucky. A similar report has been published for the Western Kentucky region and a release for the eastern region will be issued as soon as field work and tabulations are completed. Later an analytical report for the state will be published which will interpret forest area, timber-volume, growth, and drain statistics in the light of existing and anticipated economic conditions.

LOCATION OF FOREST SURVEY REGIONS IN KENTUCKY

■ AREA COVERED BY THIS REPORT

SIGNIFICANT FOREST STATISTICS FOR CENTRAL KENTUCKY

Central Kentucky, as defined in this report, includes four principal subdivisions or regions. These have been established in such a way as to group counties that have similar forest, soil, and economic conditions. Although local regional names have been given to each, the areas included do not necessarily coincide with local terminology. For example, the southern portion of the Western Coalfield region includes several counties frequently classified as Western Pennyroyal. In general, the terrain of Central Kentucky slopes gradually upward from the west to the adjacent mountainous area on the east. The rivers that drain this area flow into the Ohio. A brief description of the physiographic and economic characteristics of each region follows.

Western Coalfield.--This is an area of gently to sharply rolling hills where the elevation varies from 350 to 700 feet. The central portion is the most hilly and more gently rolling areas are found along the Ohio River and toward the Tennessee line. Agriculture and coal mining are important activities. Tobacco, livestock, and general farm crops are produced.

Pennyroyal.--The soft limestone underlying much of this hilly area has in places dissolved, causing sink holes and extensive drainage. Accordingly, the area is generally drier than other parts of the state. This, together with a hilly terrain, results in a less productive agriculture and an increased proportion of forest land.

Bluegrass.--The rich Inner Bluegrass is characterized by a productive agriculture based largely on grazing and tobacco growing. This is the area of large estates and is the "story book" portion of the state. Surrounding this area is a less fertile hilly fringe (Outer Bluegrass) given principally to livestock raising. The soils of this fringe are thin, relatively unproductive, and easily eroded. Farm values are consequently lower than in the Inner Bluegrass.

Cumberland.--This is an area of rough, almost mountainous topography. It is heavily forested, and successful agriculture is restricted to small, scattered farms on the lower slopes and stream bottoms. Elevation ranges from 500 to 2,000 feet.

The total land area of Central Kentucky is 21.3 million acres, of which 9.0 million acres or 42 percent is forested. In general, the counties in the Bluegrass region have the smallest forest area--in some counties as small as 2 to 4 percent of the land area. For the most part, the counties in the Cumberland region have the highest proportion of forest land, ranging as high as 90 percent. The forest area of counties in the Western Coalfield and Pennyroyal regions varies generally from one-third to one-half of the total land area.

The forest land ownership is almost entirely private, 93 percent. The Cumberland National Forest, the Mammoth Cave National Park, and state forests account for most of the remaining 7 percent.

Throughout Central Kentucky the oak-hickory and mixed-hardwood types predominate and together make up 70 to 75 percent of the commercial forest area. Although some pine is found in all parts of the area, it is most important commercially in the Cumberland region where the pine and oak-pine types occupy 19 percent of the commercial forest area.

Stands of saw-timber size and quality make up 38 percent of the total commercial forest area. However, in the Bluegrass region saw-timber stands occupy less than 20 percent of the commercial forest area. Considering all regions, pole timber predominates on about 40 percent of the commercial forest area and seedling and sapling on 15 percent. The remaining 7 percent is classified as nonstocked.

The total volume of saw timber in Central Kentucky is 16.9 billion board feet. Of this total, 3.7 billion board feet are in the Western Coalfield region, 4.3 billion in the Pennyroyal region, 1.3 in the Bluegrass, and 7.6 in the Cumberland. The oaks make up more than 45 percent of this volume. Hickory with 10 percent and yellow-poplar with 7 percent are also important. More than 80 percent of the saw-timber volume is found in stands classified as saw timber. Nearly all of the remaining saw-timber volume occurs in scattered trees in pole-timber stands. Forty-two percent of the saw-timber volume occurs in trees 12 to 14 inches d.b.h. and 26 percent is in trees 20 inches d.b.h. or larger.

The proportion of the saw-timber volume in high-quality logs is very low. Only 13 percent of the hardwood volume is in grade 1 and 2 logs, from which come the high-quality material required by the veneer, furniture, and cooperage industries. This condition is partly due to the large proportion of small saw-timber trees in the stand. The practice of cutting only the best trees and leaving the lower-quality trees also contributes to this condition.

The volume of the total forest growing stock is 4.9 billion cubic feet. Of this 2.7 billion cubic feet are in the sawlog portion of saw-timber trees and 2.2 billion in trees of pole-timber size. In addition to this growing stock 3.0 billion cubic feet are found in tops and limbs of saw-timber trees and in the sound portion of cull trees and trees of noncommercial species.

The average volume of saw timber per acre on all commercial forest land in Central Kentucky is 1,897 board feet. By regions these average board-foot volumes per acre vary as follows: Western Coalfield, 2,148; Pennyroyal, 2,045; Bluegrass, 1,038; and Cumberland, 1,974. Large saw-timber stands averaged 5,237 board feet per acre, and those classified as small saw timber averaged 3,098 board feet per acre. The average volume per acre of growing stock on commercial forest land was 549 cubic feet.

WESTERN COALFIELD

FOREST SURVEY PROCEDURE

The inventory of the forest resources of Central Kentucky was made during the period October 1948 to November 1949. A sampling procedure was used involving an office study of aerial photographs and a field examination of randomly selected forest and nonforest plots.

The proportion of forest land in each county was obtained by placing a transparent template marked with uniformly spaced dots over aerial photographs and by counting the number of dots falling on forest and nonforest areas. The percentage of the dots in a county that was forest, multiplied by the total area gave a preliminary estimate of the forest area. This was later adjusted after field examination.

The location of a selected number of dots falling on forest land was marked on the photographs. The acre surrounding each marked dot was examined under stereoscope and was classified by stand-size class on the basis of the height, crown width, and density of trees on the plot. Plots to be examined in the field were randomly drawn from those classified under stereoscope. In making this selection the greatest weight was given to the stand-size classes containing the largest timber volume. In addition, a number of nonforest plots was selected for field examination to measure the movement of open land to forest since the date of photography.

The locations of the selected field plots were marked on the photographs, which were then sent to the field. Crews of two men each located these points on the ground. On forest land a 1/5-acre plot was established on which forest conditions were described and the species, size, quality, and growth of trees were recorded.

The following tabulation gives the number of dots and plots examined for each of the four regions.

	<u>Western Coalfield Region</u>	<u>Pennyroyal Region</u>	<u>Bluegrass Region</u>	<u>Cumberland Region</u>
Number of photo dots counted for forest-area determination	32,296	24,085	33,477	28,878
Number of forest plots stereoscopically examined on photos	2,070	2,155	1,450	3,789
Number of forest plots field examined	418	362	224	694
Number of nonforest plots field examined	160	100	161	118

ACCURACY OF DATA

Statistical analysis of forest area and timber volume data shows the following sampling errors^{1/} for each of the four regions.

<u>Region</u>	<u>Forest area</u>		<u>Saw-timber volume</u>	
	<u>M acres</u>	<u>Percent</u>	<u>Million cu. ft.</u>	<u>Percent</u>
Western Coalfield	38.5	2.2	42.4	3.9
Pennyroyal	76.0	3.6	45.5	3.7
Bluegrass	87.9	7.2	30.3	6.4
Cumberland	80.6	2.1	56.9	2.7

These estimates of sampling error do not include errors resulting from the development and application of volume tables and cull factors, or from mistakes in measurement or judgment. All phases of field and office work were closely supervised to keep these errors to a minimum. Since the percentage error increases with each subdivision of the total, small acreages or volumes may have large errors and may therefore indicate only relative magnitudes.

^{1/} At one standard deviation; i.e., the chances are two out of three that, if the survey were repeated, the total forest area or volume figures would not differ more than the errors shown in this table.

EXPLANATION OF TERMS USED

Forest land.--Land bearing forest growth or land from which the forest has been removed but which shows evidence of past forest occupancy and which is not now in other use. To qualify as forest, an area must (1) be at least 100 feet wide; (2) be at least 1 acre in area; (3) have a sufficient number of trees to provide 10 percent crown coverage; or (4) lacking 10 percent crown coverage, be likely to remain in forest use.

Commercial forest land.--Forest land bearing or capable of bearing timber of commercial character and economically available now or prospectively for commercial use and not withdrawn from such use.

Reserved forest land.--Forest land that has been withdrawn from timber utilization through statute, ordinance, or administrative order.

Noncommercial forest land.--Forest land incapable of yielding usable wood products because of adverse site conditions, or so physically inaccessible as to be permanently unavailable economically, and not withdrawn for specified purposes.

Forest types

Pine.--Stands in which pine species comprise at least 60 percent of the dominant and codominant trees.

Cedar-hardwoods.--Stands in which redcedar comprises at least 20 percent of the dominant and codominant trees.

Oak-pine.--Stands of pines, oak, and other hardwoods in which pines comprise 20-60 percent of the dominant and codominant trees.

Oak-hickory.--Stands of hardwoods in which oaks and hickories comprise at least 60 percent of the dominant and codominant trees.

White oak.--Stands in which white oak (*Quercus alba*) comprises at least 60 percent of the dominant and codominant trees.

Beech-maple.--Stands in which beech and sugar maple comprise at least 60 percent of the dominant and codominant trees.

Mixed hardwoods.--Stands of mixed hardwood species not qualifying for other hardwood types. Principal species include yellow-poplar, elm, maple, basswood, ash, beech, hemlock, and black locust in mixture with oaks and hickories.

Bottomland hardwoods.--Stands on the alluvial bottoms of rivers and streams. The principal species include sycamore, willow, elm, blackgum, sweetgum, soft maple, oaks, hickory, cottonwood, and cypress.

Tree classes

Saw-timber tree.--A live softwood (coniferous) tree at least 9.0 inches d.b.h. or live hardwood trees of commercial species at least 11.0 inches d.b.h., with a sound butt log at least 8 feet long, or with at least half of the gross volume of the tree in sound material.

Pole-timber tree.--A live tree at least 5.0 inches d.b.h. but less than saw-timber size that gives promise of becoming a saw-timber tree.

Cull tree.--A live tree at least 5.0 inches d.b.h. that does not qualify as a saw-timber or pole-timber tree because of species, poor form, limbiness, rot, or other defect.

Volume estimates

Board-foot volume includes the volume of that portion of saw-timber trees merchantable for sawlogs. Volume deductions have been made for rot, crook, and other defects. Board-foot volumes are shown in the International 1/4-inch log rule, which approximates green lumber tally.

Cubic-foot volume

Total volume includes the sound wood inside bark in both sound and cull living trees 5.0 inches d.b.h. and larger, from the stump to a minimum top diameter of 4.0 inches inside bark. It includes the upper stems of softwood trees and the upper stems and limbs of hardwoods.

Growing stock includes the volume of sound wood inside bark in (1) the sawlog portion of saw-timber trees, (2) the upper stem of softwood saw-timber trees to a minimum top diameter of 4.0 inches inside bark, and (3) pole-timber trees to a minimum top diameter of 4.0 inches inside bark.

Stand-size class

Large saw timber.--Stands having a minimum net volume of 1500 board feet per acre in saw-timber trees, and having more than half of this volume in trees 15.0 inches d.b.h. and larger.

Small saw timber.--Stands having a net volume of 1500 board feet per acre in saw-timber trees, and having at least half of this volume in trees smaller than 15.0 inches d.b.h.

Pole timber.--Stands failing to meet the saw-timber stand specifications, but at least 10 percent stocked with pole-timber and larger trees and with at least half the minimum stocking in pole-timber trees.

Seedlings and saplings.--Stands not qualifying either for saw timber or pole timber but having at least 300 seedlings and saplings of commercial species per acre.

Nonstocked.--Commercial forest land not qualifying for any other class.

Hardwood log grades

Grade 1.--Logs at least 14.0 inches in diameter inside bark with five-sixths of the surface on the three best faces clear of defect in not more than two cuttings. Lumber from such logs will normally grade at least 60 percent No. 1 common and better.

Grade 2.--Logs at least 12 inches in diameter inside bark with two-thirds of the surface on the three best faces clear of defect in not more than three cuttings. Lumber from such logs will normally grade at least 35 percent No. 1 common and better.

Grade 3.--Merchantable logs at least 8.0 inches in diameter inside bark which do not meet the requirements of higher grades. Such logs will normally produce less than 35 percent No. 1 common and better lumber or will be suitable only for ties or timbers.

Species listed

Softwoods

Virginia pine	- <u>Pinus virginiana</u>
Shortleaf pine includes:	
Shortleaf pine	- <u>Pinus echinata</u>
Pitch pine	- <u>Pinus rigida</u>
White pine	- <u>Pinus strobus</u>
Cypress	- <u>Taxodium distichum</u>
Redcedar	- <u>Juniperus virginiana</u>
Hemlock	- <u>Tsuga canadensis</u>

Hardwoods

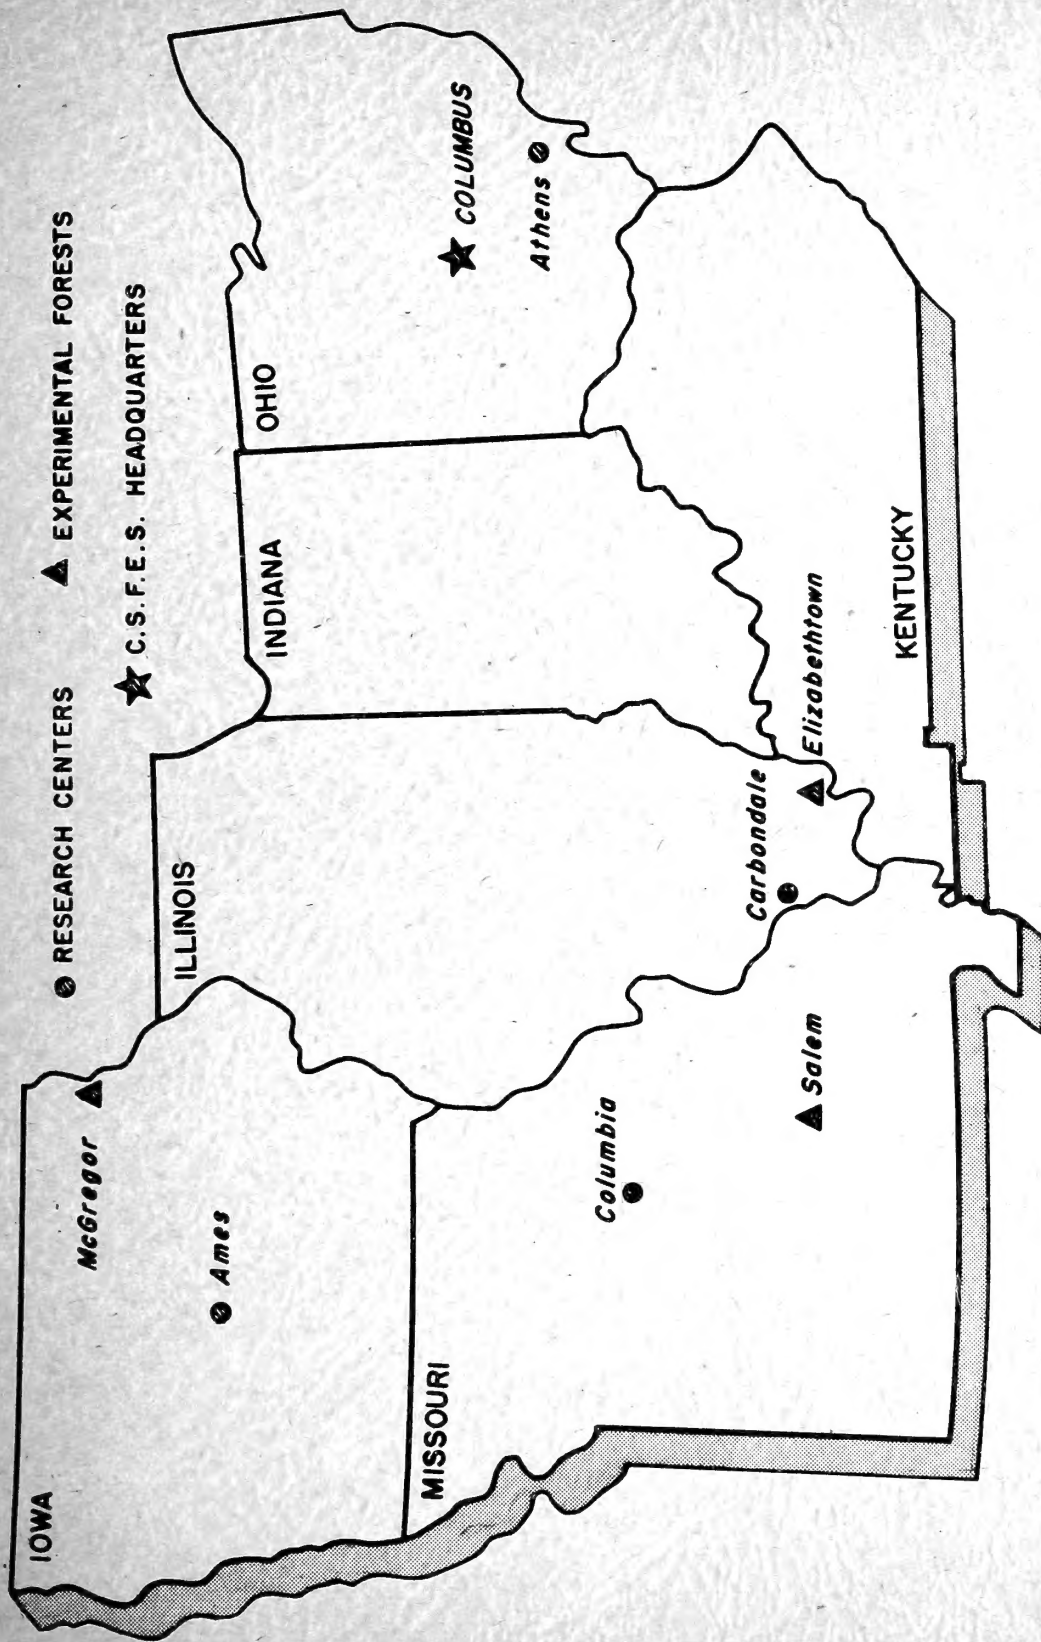

White oak	- <u>Quercus alba</u>
Post oak group includes:	
Post oak	- <u>Quercus stellata</u>
Swamp white oak	- <u>Quercus bicolor</u>
Swamp chestnut oak	- <u>Quercus prinus</u>
Overcup oak	- <u>Quercus lyrata</u>
Bur oak	- <u>Quercus macrocarpa</u>
Chinquapin oak	- <u>Quercus muehlenbergii</u>
Chestnut oak	- <u>Quercus montana</u>
Black oak includes:	
Black oak	- <u>Quercus velutina</u>
Scarlet oak	- <u>Quercus coccinea</u>

Northern red oak includes:

- Northern red oak - Quercus borealis
 - Swamp red oak - Quercus falcata var. pagodaefolia
- Other red oaks include:
- Southern red oak - Quercus falcata
 - Pin oak - Quercus palustris
 - Willow oak - Quercus phellos
 - Water oak - Quercus nigra
 - Shingle oak - Quercus imbricaria
- Hickory - Carya species
- Elm - Ulmus species
- Soft maple includes:
- Red maple - Acer rubrum
 - Silver maple - Acer saccharinum
 - Boxelder - Acer negundo
- Sugar maple - Acer saccharum
- Sycamore - Platanus occidentalis
- Ash - Fraxinus species
- Yellow-poplar - Liriodendron tulipifera
- Cottonwood - Populus deltoides
- Sweetgum - Liquidambar styraciflua
- Blackgum - (Nyssa sylvatica)
(Nyssa aquatica)
- Beech - Fagus grandifolia
- Black walnut - Juglans nigra
- Other hardwoods - include all other commercial hardwood species.

Noncommercial species - include species that do not normally have commercial value such as hawthorn, redbud, hornbeam, hophornbeam, alder, and serviceberry.
